

# Proxmox Virtual Environment

## Указать FQDN hostname для lxc контейнера

```
touch /etc/.pve-ignore.hostname  
nano /etc/hostname  
reboot
```

## Не восстанавливается непривилегированный lxc

```

# TASK ERROR: unsupported Debian version

Не удастся запустить или развернуть lxc контейнер свежего дистрибутива, на устаревшем PVE:

```
extracting archive '/var/lib/vz/template/cache/ubuntu-23.10-standard_23.10-1_amd64.tar.gz'  
Total bytes read: 546263040 (521MiB, 110MiB/s)  
Detected container architecture: amd64  
Logical volume "vm-131-disk-0" successfully removed  
TASK ERROR: unable to create CT 131 - unsupported Ubuntu version '23.10'
```

Надо поменять скрипт `/usr/share/perl5/PVE/LXC/Setup/Ubuntu.pm` так:

```
my $known_versions = {  
    '23.10' => 1, # mantic <-----  
    '20.04' => 1, # focal LTS  
    '19.10' => 1, # eoan
```

или `/usr/share/perl5/PVE/LXC/Setup/Debian.pm` так:

```
die "unsupported debian version '$version'\n"  
if !($version >= 4 && $version <= 13);
```

Как применить изменения не перезагружая PVE машину - не знаю.

Взял [тут](#)
